FitBuddy — Phase 1: Brainstorming & Ideation

Project: AI Fitness Plan Generator using Gemini Models

Purpose

• Prepared from the supplied FitBuddy project document. This document is a submission-ready phase artifact/template; it does not claim that implementation, testing, screenshots, or deployment have been completed unless you add evidence from your actual project.

• Identify the problem, proposed solution, target users, major scenarios, and the value of using generative AI.

Problem Statement

People may need structured fitness guidance tailored to their goals, intensity, and preferences. FitBuddy proposes a web application that generates a personalized 7-day workout plan and a complementary nutrition or recovery tip, with the ability to revise the plan using user feedback.

Proposed Solution

FitBuddy is a web-based AI application using Google Gemini models, FastAPI, Jinja2 templates, and SQLite/SQLAlchemy. Users provide basic fitness information and receive a structured plan. Feedback can be used to regenerate an updated plan.

Target Users / Stakeholders

• Individuals seeking a structured starting workout plan.

• Administrators or coaches who need an overview of registered users and their plans.

• Project developers responsible for maintaining the application.

Core Scenarios

• Scenario 1 — Generate a personalized 7-day workout plan from user details.

• Scenario 2 — Submit feedback such as requesting more cardio or additional rest days and receive an updated plan.

• Scenario 3 — Receive a nutrition or recovery tip aligned with the selected fitness goal.

• Scenario 4 — An admin/coach views registered users and their original and updated plans.

Initial Feature List

• User input form.

• AI-generated 7-day workout plan.

• Nutrition/recovery tip.

• Feedback-based plan update.

• SQLite database storage.

• Admin view of users and plans.

• FastAPI routes and interactive API documentation.

Expected Outcome

A working web application demonstrating AI-assisted fitness-plan generation, persistent storage, dynamic feedback-based updates, and an administrative view.
